

VACCINE INFO

FEBRUARY 2016

The vaccine schedule has tripled, from 1986 to 2016, to 74 doses of 17 vaccines by age 18¹. Many of these vaccines are given in combination with others. There have been no studies to support the safety and effectiveness of vaccine combinations. Vaccine manufacturers and physicians obtained immunity from liability for any adverse reactions or death in 1986 when Congress passed the National Vaccine Injury Act². The Supreme Court, in *Brusewitz v. Wyeth* (2011) ruled that vaccines are **UNAVOIDABLY UNSAFE**³.

Adverse reactions that do get compensated come from the Vaccine Injury Compensation program are funded by a \$0.75 tax per vaccine paid for by patients⁴. Over \$3.3 billion has been paid for vaccine injuries and deaths⁵. The CDC estimates that the reporting of adverse reactions from vaccines to the CDC/FDA Vaccine Adverse Event Reporting System (VAERS) is only 1 to 10% of the actual number of incidents^{6,7}. Given these estimates, there are anywhere from 300,000 to 2 million adverse reactions annually⁸.

The vaccine information sheet given by your pediatrician is NOT the actual manufacture's vaccine insert and omits critical information. The actual inserts are 12-20 pages long and list several warnings and adverse reactions, which include seizures, encephalopathy and death⁹. Reported reactions listed also include SIDS, and autism. Vaccine ingredients include: Thimerosal, aluminum, formaldehyde, MSG, acetone, glycerin, lead, yeast, animal DNA, unidentified animal viruses, polysorbate 80, and aborted fetal tissue (diploid cells)¹⁰. It's not known how these neurotoxins, animal and human DNA effect our immune systems.

Autism rates were 1 in 2,500 in 1985 and are now 1 in 45. Currently 27% of children are chronically ill; 1 in 6 children have learning disabilities, 1 in 10 have ADHD, 1 in 13 have food allergies, 1 in 10 have asthma, 1 in 20 have seizures. It is estimated that 33% of childhood illnesses are caused by environmental exposure¹¹. There is also a rise in childhood cancers, autoimmune disorders such as Type 1 Diabetes, Juvenile RA and Lupus¹¹.

Vaccine targeted diseases often occur in vaccinated individuals. This happens because the vaccine's effectiveness wanes quickly, the virus mutates from the vaccine strain or because some individuals are non-responders. Live virus vaccines such as MMR, Varicella, Rotavirus, Shingles and live flu vaccines can shed and spread infection to others for up to 6 weeks after vaccination¹².

90% of morbidity and mortality from both vaccine targeted diseases and non-vaccine targeted diseases declined at the same rate before mass vaccinations were implemented¹³. Better sanitation, hygiene, nutrition and clean water have had the greatest effect on overall disease prevention NOT vaccines.

Dr. William Thompson, a CDC senior scientist turned whistleblower has admitted that statistically significant data in a 2004 Pediatrics Journal linking the MMR vaccine to autism was intentionally OMITTED by order of the CDC¹⁴. Efforts are being made to get a congressional hearing in order to reveal the truth about this effort to cover up a link between the MMR and Autism¹⁵.

Have we traded normal childhood diseases that involve a fever, cough and a rash in most and provide lifetime immunity for a multitude of chronic illnesses that last a life time?
